#### Abstract

In this paper, we introduce the sequence space $V_{\sigma}(M, p, r, \triangle)$, where $M$ is an Orlicz function, $p=\left(p_{m}\right)$ is any sequence of strictly positive real numbers and $r \geq 0$ and study some of the properties and inclusion relations that arise on the said space.

Keywords: invariant mean; paranorm; orlicz function; difference sequences.
2010 AMS Subject Classification: 40F05, 40C05, 46 A 45.

## 1. Introduction

Let $\mathrm{N}, \mathrm{R}$ and C be the sets of all natural, real and complex numbers respectively.
We write

$$
\omega=\left\{x=\left(x_{k}\right): x_{k} \in R \text { or } C\right\}
$$

the space of all real or complex sequences.
Let $\ell_{\infty}, c$ and $c_{0}$ denote the Banach spaces of bounded, convergent and null sequences respectively.

The following subspaces of $\omega$ were first introduced and discussed by Maddox [11-12].
$\ell(p)=\left\{x \in \omega: \sum_{k}\left|x_{k}\right|^{p_{k}}<\infty\right\}$,
$\ell_{\infty}(p)=\left\{x \in \omega: \sup \left|x_{k}\right|^{p_{k}}<\infty\right\}$,
$c(p)=\left\{x \in \omega: \lim _{k}^{k}\left|x_{k}-l\right|^{p_{k}}=0\right.$, for some $\left.l \in C\right\}$,
$c_{0}(p)=\left\{x \in \omega: \lim _{k}\left|x_{k}\right|^{p_{k}}=0\right\}$,
where $p=\left(p_{k}\right)$ is a sequence of striclty positive real numbers.

The concept of paranorm is closely related to linear metric spaces.It is a generalization of that of absolute value.(see[12])
Let X be a linear space. A function $g: X \longrightarrow R$ is called paranorm, if for all $x, y, z \in X$,
(PI) $g(x)=0$ if $x=\theta$,
(P2) $g(-x)=g(x)$,
(P3) $g(x+y) \leq g(x)+g(y)$,
(P4) If $\left(\lambda_{n}\right)$ is a sequence of scalars with $\lambda_{n} \rightarrow \lambda(n \rightarrow \infty)$ and $x_{n}, a \in X$ with $x_{n} \rightarrow a(n \rightarrow \infty)$, in the sense that $g\left(x_{n}-a\right) \rightarrow 0(n \rightarrow \infty)$, in the sense that $g\left(\lambda_{n} x_{n}-\lambda a\right) \rightarrow 0(n \rightarrow \infty)$.

An Orlicz function is a function $M:[0, \infty) \rightarrow[0, \infty)$, which is continuous, non-decreasing and convex with $M(0)=0, M(x)>0$ for $x>0$ and $M(x) \rightarrow \infty$ as $x \rightarrow \infty$.

Lindenstrauss and Tzafriri[9] used the idea of Orlicz functions to construct the sequence space

$$
\ell_{M}=\left\{x \in \omega: \sum_{k=1}^{\infty} M\left(\frac{\left|x_{k}\right|}{\rho}\right)<\infty, \text { for some } \rho>0\right\}
$$

The space $\ell_{M}$ is a Banach space with the norm

$$
\|x\|=\inf \left\{\rho>0: \sum_{k=1}^{\infty} M\left(\frac{\left|x_{k}\right|}{\rho}\right) \leq 1\right\}
$$

The space $\ell_{M}$ is closely related to the space $\ell_{p}$ which is an Orlicz sequence space with $M(x)=x^{p}$ for $1 \leq p<\infty$.

An Orlicz function $M$ is said to satisfy $\triangle_{2}$ condition for all values of x if there exists a constant $K>0$ such that $M(L x) \leq K L M(x)$ for all values of $L>1$.
A sequence space $E$ is said to be solid or normal if $\left(x_{k}\right) \in E$ implies $\left(\alpha_{k} x_{k}\right) \in E$ for all sequence
of scalars $\left(\alpha_{k}\right)$ with $\left|\alpha_{k}\right|<1$ for all $k \in N$.
For Orlicz function and related results see([2],[7],[15]).

Let $\sigma$ be an injection on the set of positive integers N into itself having no finite orbits and T be the operator defined on $\ell_{\infty}$ by $T\left(x_{k}\right)=\left(x_{\sigma(k)}\right)$.
A positive linear functional $\Phi$, with $\|\Phi\|=1$, is called a $\sigma$-mean or an invariant mean if $\Phi(x)=\Phi(T x)$ for all $x \in \ell_{\infty}$.

A sequence $x$ is said to be $\sigma$-convergent, denoted by $x \in V_{\sigma}$, if $\Phi(x)$ takes the same value, called $\sigma-\lim x$, for all $\sigma$-means $\Phi$. We have

$$
V_{\sigma}=\left\{x=\left(x_{k}\right): \sum_{m=1}^{\infty} t_{m, n}(x)=L \text { uniformly in } \mathrm{n}, \mathrm{~L}=\sigma-\lim x\right\}
$$

where for $m \geq 0, n>0$.

$$
t_{m, n}(x)=\frac{x_{k}+x_{\sigma(k)}+\ldots . .+x_{\sigma^{m}(k)}}{m+1}, \text { and } t_{-1, n}=0 .
$$

where $\sigma^{m}(k)$ denotes the $\mathrm{m}^{t h}$ iterate of $\sigma$ at n . In particular, if $\sigma$ is the translation, a $\sigma$-mean is often called a Banach limit and $V_{\sigma}$ reduces to f , the set of almost convergent sequences.

Subsequently the spaces of invariant mean has been studied by various authors, see( [1], [10], [13], [14], [16], [17]).

The idea of Difference sequence sets

$$
X_{\triangle}=\left\{x=\left(x_{k}\right) \in \omega: \triangle x=\left(x_{k}-x_{k+1}\right) \in X\right\}
$$

where $X=\ell_{\infty}, c$ or $c_{0}$ was introduced by Kizmaz [8].
Kizmaz [8] defined the sequence spaces,

$$
\begin{aligned}
\ell_{\infty}(\triangle) & =\left\{x=\left(x_{k}\right) \in \omega:\left(\triangle x_{k}\right) \in \ell_{\infty}\right\} \\
c(\triangle) & =\left\{x=\left(x_{k}\right) \in \omega:\left(\triangle x_{k}\right) \in c\right\} \\
c_{0}(\triangle) & =\left\{x=\left(x_{k}\right) \in \omega:\left(\triangle x_{k}\right) \in c_{0}\right\}
\end{aligned}
$$

where $\triangle x=\left(x_{k}-x_{k+1}\right)$. These are Banach spaces with the norm

$$
\|x\|_{\triangle}=\left|x_{1}\right|+\|\triangle x\|_{\infty} .
$$

For difference sequences and related results see([3-5],[7]).

## 2. Main results

Recently Ebadullah[6] introduced and studied the sequence space

$$
V_{\sigma}(M, p, r)=\left\{x=\left(x_{k}\right): \sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|t_{m, n}(x)\right|}{\rho}\right)\right]^{p_{m}}<\infty \text { uniformly in } \mathrm{n}, \rho>0\right\} .
$$

Where $M$ is an Orlicz function, $p=\left(p_{m}\right)$ is any sequence of strictly positive real numbers and $r \geq 0$.

In this article we introduce the sequence space

$$
V_{\sigma}(M, p, r, \triangle)=\left\{x=\left(x_{k}\right): \sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}}<\infty \text { uniformly in } \mathrm{n}, \rho>0\right\} .
$$

Where $M$ is an Orlicz function, $p=\left(p_{m}\right)$ is any sequence of strictly positive real numbers and $r \geq 0$.

Now we define the sequence spaces as follows;

For $M(x)=x$ we get

$$
V_{\sigma}(p, r, \triangle)=\left\{x=\left(x_{k}\right): \sum_{m=1}^{\infty} \frac{1}{m^{r}}\left|t_{m, n}(\triangle x)\right|^{p_{m}}<\infty \text { uniformly in } \mathrm{n}\right\}
$$

For $p_{m}=1$, for all m , we get

$$
V_{\sigma}(M, r, \triangle)=\left\{x=\left(x_{k}\right): \sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]<\infty \text { uniformly in } \mathrm{n}, \rho>0\right\}
$$

For $\mathrm{r}=0$ we get

$$
V_{\sigma}(M, p, \triangle)=\left\{x=\left(x_{k}\right): \sum_{m=1}^{\infty}\left[M\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}}<\infty \text { uniformly in } \mathrm{n}, \rho>0\right\}
$$

For $M(x)=x$ and $\mathrm{r}=0$ we get

$$
V_{\sigma}(p, \triangle)=\left\{x=\left(x_{k}\right): \sum_{m=1}^{\infty}\left|t_{m, n}(\triangle x)\right|^{p_{m}}<\infty \text { uniformly in } \mathrm{n}, \rho>0\right\}
$$

For $p_{k}=1$, for all m and $\mathrm{r}=0$, we get

$$
V_{\sigma}(M, \triangle)=\left\{x=\left(x_{k}\right): \sum_{m=1}^{\infty}\left[M\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]<\infty \text { uniformly in } \mathrm{n}, \rho>0\right\}
$$

For $M(x)=x, p_{m}=1$, for all m and $\mathrm{r}=0$, we get

$$
V_{\sigma}(\triangle x)=\left\{x=\left(x_{k}\right): \sum_{m=1}^{\infty}\left|t_{m, n}(\triangle x)\right|<\infty \text { uniformly in } \mathrm{n}\right\} .
$$

Theorem 2.1. The sequence space $V_{\sigma}(M, p, r, \triangle)$ is a linear space over the field C of complex numbers.

Proof. Let $x, y \in V_{\sigma}(M, p, r, \triangle)$ and $\alpha, \beta \in C$ then there exists positive numbers $\rho_{1}$ and $\rho_{2}$ such that

$$
\sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho_{1}}\right)\right]^{p_{m}}<\infty,
$$

and

$$
\sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|t_{m, n}(\triangle y)\right|}{\rho_{2}}\right)\right]^{p_{m}}<\infty
$$

uniformly in n .
Define $\rho_{3}=\max \left(2|\alpha| \rho_{1}, 2|\beta| \rho_{2}\right)$.
Since $M$ is non decreasing and convex we have

$$
\sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|\alpha t_{m, n}(\triangle x)+\beta t_{m, n}(\Delta y)\right|}{\rho_{3}}\right)\right]^{p_{m}}
$$

$$
\begin{aligned}
& \leq \sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|\alpha t_{m, n}(\triangle x)\right|}{\rho_{3}}+\frac{\left|\beta t_{m, n}(\Delta y)\right|}{\rho_{3}}\right)\right]^{p_{m}} \\
& \leq \sum_{m=1}^{\infty} \frac{1}{m^{r}} \frac{1}{2}\left[M\left(\frac{t_{m, n}(\triangle x)}{\rho_{1}}\right)+M\left(\frac{t_{m, n}(\Delta y)}{\rho_{2}}\right)\right]<\infty
\end{aligned}
$$

uniformly in n .
This proves that $V_{\sigma}(M, p, r, \triangle)$ is a linear space over the field C of complex numbers.

Theorem 2.2. For any Orlicz function M and a bounded sequence $p=\left(p_{m}\right)$ of strictly positive real numbers, $V_{\sigma}(M, p, r, \triangle)$ is a paranormed space with

$$
g(x)=\inf _{n \geq 1}\left\{\rho^{\frac{p_{n}}{H}}:\left(\sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}}\right)^{\frac{1}{H}} \leq 1, \text { uniformly in } \mathrm{n}\right\}
$$

where $\mathrm{H}=\max \left(1, \sup p_{m}\right)$.

Proof. It is clear that $g(\triangle x)=g(-\triangle x)$.
Since $M(0)=0$, we get
$\inf \left\{\rho^{\frac{p_{m}}{H}}\right\}=0$, for $x=0$
Now for $\alpha=\beta=1$, we get
$g(\triangle x+\triangle y) \leq g(\triangle x)+g(\triangle y)$.

For the continuity of scalar multiplication let $l \neq 0$ be any complex number. Then by the definition we have

$$
g(l \triangle x)=\inf _{n \geq 1}\left\{\rho^{\frac{p_{n}}{H}}:\left(\sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|t_{m, n}(l \triangle x)\right|}{\rho}\right)\right]^{p_{m}}\right)^{\frac{1}{H}} \leq 1, \text { uniformly in } \mathrm{n}\right\}
$$

$$
g(l \triangle x)=\inf _{n \geq 1}\left\{(|l| s)^{\frac{p_{n}}{H}}:\left(\sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|t_{m, n}(l \triangle x)\right|}{(|l| s)}\right)\right]^{p_{m}}\right)^{\frac{1}{H}} \leq 1, \text { uniformly in } \mathrm{n}\right\}
$$

where $s=\frac{\rho}{|l|}$.
Since $|l|^{p_{m}} \leq \max \left(1,|l|^{H}\right)$, we have

$$
\begin{gathered}
g(l \triangle x) \leq \max \left(1,|l|^{H}\right) \inf _{n \geq 1}\left\{s^{\frac{p_{n}}{H}}:\left(\sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|t_{m, n}(\triangle x)\right|}{(|l| s)}\right)\right]^{p_{m}}\right)^{\frac{1}{H}} \leq 1, \text { uniformly in } \mathrm{n}\right\} \\
g(\triangle l x) \leq \max \left(1,|l|^{H}\right) g(\triangle x)
\end{gathered}
$$

Therefore $g(\triangle x)$ converges to zero when $g(\triangle x)$ converges to zero in $V_{\sigma}(M, p, r, \triangle)$.

Now let $x$ be fixed element in $V_{\sigma}(M, p, r, \triangle)$. There exists $\rho>0$ such that

$$
g(\triangle x)=\inf _{n \geq 1}\left\{\rho^{\frac{p_{n}}{H}}:\left(\sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}}\right)^{\frac{1}{H}} \leq 1, \text { uniformly in } \mathrm{n}\right\}
$$

Now

$$
g(l \triangle x)=\inf _{n \geq 1}\left\{\rho^{\frac{p_{n}}{H}}:\left(\sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|t_{m, n}(l \triangle x)\right|}{\rho}\right)\right]^{p_{m}}\right)^{\frac{1}{H}} \leq 1, \text { uniformly in } \mathrm{n}\right\} \rightarrow 0 \text { as } l \rightarrow 0 .
$$

This completes the proof.

Theorem 2.3. The sequence space

$$
V_{\sigma}(M, p, r, \triangle)=\left\{x=\left(x_{k}\right): \sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}}<\infty \text { uniformly in } \mathrm{n}, \rho>0\right\} .
$$

is a Banach space with the norm

$$
g(\triangle x)=\inf _{n \geq 1}\left\{\rho^{\frac{p_{n}}{H}}:\left(\sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}}\right)^{\frac{1}{H}} \leq 1\right\} .
$$

Theorem 2.4. Suppose that $0<p_{m}<t_{m}<\infty$ for each $m \in N$ and $r>0$. Then
(a) $V_{\sigma}(M, p, \triangle) \subseteq V_{\sigma}(M, t, \triangle)$.
(b) $V_{\sigma}(M, \triangle) \subseteq V_{\sigma}(M, r, \triangle)$

Proof.(a) Suppose that $x \in V_{\sigma}(M, p, \triangle)$.
This implies that $\left.\left[M\left(\frac{\left|t_{i, n}(\Delta x)\right|}{\rho}\right)\right]^{p_{m}}\right) \leq 1$
for sufficiently large value of i , say $i \geq m_{0}$ for some fixed $m_{0} \in N$.
Since $M$ is non decreasing, we have

$$
\sum_{m=m_{0}}^{\infty}\left[M\left(\frac{\left|t_{i, n}(\triangle x)\right|}{\rho}\right)\right]^{t_{m}} \leq \sum_{m=m_{0}}^{\infty}\left[M\left(\frac{\left|t_{i, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}}<\infty
$$

Hence $x \in V_{\sigma}(M, t, \triangle)$.
(b) The proof is trivial.

Corollary 2.5. $0<p_{m} \leq 1$ for each m , then $V_{\sigma}(M, p, \triangle) \subseteq V_{\sigma}(M, \triangle)$
If $p_{m} \geq 1$ for all m , then $V_{\sigma}(M, \triangle) \subseteq V_{\sigma}(M, p, \triangle)$.

Theorem 2.6. The sequence space $V_{\sigma}(M, p, r, \triangle)$ is solid.

Proof. Let $x \in V_{\sigma}(M, p, r, \triangle)$. This implies that

$$
\sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}}<\infty
$$

Let $\alpha_{m}$ be a sequence of scalars such that $\left|\alpha_{m}\right| \leq 1$ for all $m \in N$. Then the result follows from the following inequality.

$$
\sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|\alpha_{m} t_{i, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}} \leq \sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M\left(\frac{\left|t_{i, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}}<\infty
$$

Hence $\alpha x \in V_{\sigma}(M, p, r, \triangle)$ for all sequence of scalars $\left(\alpha_{m}\right)$ with $\left|\alpha_{m}\right| \leq 1$ for all $m \in N$ whenever $x \in V_{\sigma}(M, p, r, \triangle)$.

Corollary 2.7. The sequence space $V_{\sigma}(M, p, r, \triangle)$ is monotone.

Theorem 2.8. Let $M_{1}, M_{2}$ be Orlicz function satisfying $\triangle_{2}$ condition and $r, r_{1}, r_{2} \geq 0$. Then we have
(a) If $r>1$ then $V_{\sigma}\left(M_{1}, p, r, \triangle\right) \subseteq V_{\sigma}\left(M 0 M_{1}, p, r, \triangle\right)$,
(b) $V_{\sigma}\left(M_{1}, p, r, \triangle\right) \cap V_{\sigma}\left(M_{2}, p, r, \triangle\right) \subseteq V_{\sigma}\left(M_{1}+M_{2}, p, r, \triangle\right)$,
(c) If $r_{1} \leq r_{2}$ then $V_{\sigma}\left(M, p, r_{1}, \triangle\right) \subseteq V_{\sigma}\left(M, p, r_{2}, \triangle\right)$.

Proof. (a) Since $M$ is continuous at 0 from right, for $\varepsilon>0$ there exists $0<\delta<1$ such that $0 \leq c \leq \delta$ implies $M(c)<\varepsilon$.

If we define

$$
\begin{aligned}
& I_{1}=\left\{m \in N: M_{1}\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right) \leq \delta \text { for some } \rho>0\right\}, \\
& I_{2}=\left\{m \in N: M_{1}\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)>\delta \text { for some } \rho>0\right\},
\end{aligned}
$$

when

$$
M_{1}\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)>\delta
$$

we get

$$
M\left(M_{1}\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right) \leq\left\{\frac{2 M(1)}{\delta}\right\} M_{1}\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)
$$

Hence for $x \in V_{\sigma}\left(M_{1}, p, r, \triangle\right)$ and $r>1$

$$
\begin{gathered}
\sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M 0 M_{1}\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}}=\sum_{m \in I_{1}} \frac{1}{m^{r}}\left[M 0 M_{1}\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}}+\sum_{m \in I_{2}} \frac{1}{m^{r}}\left[M 0 M_{1}\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}} . \\
\sum_{m=1}^{\infty} \frac{1}{m^{r}}\left[M 0 M_{1}\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}} \leq \max \left(\varepsilon^{h}, \varepsilon^{H}\right) \sum_{m=1}^{\infty} \frac{1}{m^{r}}+\max \left(\left\{\frac{2 M_{1}}{\delta}\right\}^{h},\left\{\frac{2 M_{1}}{\delta}\right\}^{H}\right)
\end{gathered}
$$

where $0<h=\inf p_{m} \leq p_{m} \leq H=\sup _{m} p_{m}<\infty$
(b)The proof follows from the following inequality

$$
\frac{1}{m^{r}}\left[\left(M_{1}+M_{2}\right)\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}} \leq C \frac{1}{m^{r}}\left[M_{1}\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}}+C \frac{1}{m^{r}}\left[M_{2}\left(\frac{\left|t_{m, n}(\triangle x)\right|}{\rho}\right)\right]^{p_{m}}
$$

(c)The proof is straightforward.

Corollary 2.9. Let $M$ be an Orlicz function satisfying $\triangle_{2}$ condition. Then we have
(a) If $r>1$ then $V_{\sigma}(p, r, \triangle) \subseteq V_{\sigma}(M, p, r, \triangle)$,
(b) $V_{\sigma}(M, p, \triangle) \subseteq V_{\sigma}(M, p, r, \triangle)$,
(c) $V_{\sigma}(p, \triangle) \subseteq V_{\sigma}(p, r, \triangle)$,
(d) $V_{\sigma}(M, \triangle) \subseteq V_{\sigma}(M, r, \triangle)$.

Proof. The proof is straightforward.

## Conflict of Interests

The author declares that there is no conflict of interests.
